Windows x64	206.42 MB	jdk-8u152-windows-x64.exe

Install JDK

Run the previously downloaded file and follow the instructions. The JDK includes the JRE so you have to specify both installation paths. Both of them shouldn't be changed so they're installed to `C:\Java\jdk1.8.0_152`.

Glassfish Server Setup

Download Glassfish

Download the latest Full Platform Server from https://javaee.github.io/glassfish/download.
(January 2018: version 4.1.2)

Install Glassfish

Extract the compressed zip-file to `C:` (it gets extracted `to C:\glassfish4`).

Further Steps to Setup the Glassfish Server will be taken after eclipse is installed (next chapter).

Eclipse for JEE Developers Setup

Download Eclipse

Download the latest 64-bit version of Eclipse for JEE from https://www.eclipse.org/downloads/eclipse-packages/.

(January 2018: Eclipse Oxygen)

Then simply unzip in C: (it gets extracted to C:\eclipse) and run Eclipse.

For convenience: **`Right click`** `eclipse.exe -> send to -> desktop (create shortcut)`

First Start

You can select now any directory you want, but to keep it simple just leave it how it is.
Tick "use this as default and do not ask again" and press "OK".

Install JDK in Eclipse

Add Glassfish Tools for Eclipse

`Help -> Eclipse Marketplace -> search for "glassfish"`

Setup Glassfish with Eclipse

After the software has finished installing restart Eclipse.

Change your view in the top right corner to Java EE.

Then click on the Servers-tab which should be at the bottom area. Afterwards click on the blue underlined text to setup a new one.

Falls kein Glassfish Eintrag gefunden wird, diesen Schritt zuerst durchführen and Reboot.

New Server

Start Glassfish Admin Console

Right click the server and start it.

Then you have to allow the access of the Server when you are prompted.

After that **right click** on Glassfish Select Glassfish -> View Admin Console

And then (after a while) you will see the picture down below.

Deploy whenever you press CTRL-S to your source file

Ctrl-S (Save) to save the changes!

Testing JEE installation

Test the Installation: Create first Servlet and JSP, deploy and run it

Right click in Project section of eclipse:

```
File -> New -> Dynamic Web Project
```

Right click the newly created `Project -> Run As -> run on server`

An **index.jsp** has been created in the WebContent folder of the project. Double-Click on **index.jsp** to open it in editor.
If you can't find the **index.jsp** file, then **right click** on:
WebContent-> New -> JSP File. (if you can't find JSP File then go: New -> Other -> Web -> JSP File) and change the filename to **index.jsp**. Now open it.

When you go to your **index.jsp** opened in the editor, replace its code with the code below and run it.

```
<%@page contentType="text/html" pageEncoding="UTF-8"%>
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
                      "http://www.w3.org/TR/html4/loose.dtd">

<html>
  <head>
        <meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
        <title>GlassFish JSP Page</title>
  </head>
  <body>
    <h1>Hello World!</h1>
  </body>
</html>
```

You should now see a big Hello World! If not, you probably did something wrong in the previous steps or you need to fully reload the page. Just press CTRL+F5 and give it a bit of time.

Hint: Just press CTRL-S (to save the changes in the source code) and eclipse will automatically deploy the changes to the application-server.

File -> New -> Other -> Web -> Servlet

Your project structure should look like this:

First Servlet Code

Replace in the generated Servlet-Class all methods with the code from below, press Crtl+Shift+O and save it.

```
package com.rothlin.hwz;

import java.io.IOException;

import javax.servlet.ServletConfig;
import javax.servlet.ServletException;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;

@WebServlet("/FirstServlet")
public class FirstServlet extends HttpServlet {
        private static final long serialVersionUID = 1L;

        public FirstServlet() {
                super();
                System.out.println("FirstServlet ctr is called! Object created!!!");
        }

        public void init(ServletConfig servletConfig) throws ServletException {
                System.out.println("FirstServlet init() is called!");
        }

        public void destroy() {
                System.out.println("FirstServlet destroy() is called!");
        }

        private void serveRequest(HttpServletRequest request, HttpServletResponse response, String methode)
                throws ServletException, IOException {
                response.setContentType("text/html");
                StringBuffer sb = new StringBuffer("<html>\n<head>\n</head>\n<body>\n");
                sb.append("<H1>Hallo HWZ!</H1> Methode:<B>" + methode + "</B><br/>\n");
                sb.append("</body>\n</html>\n");
                response.getWriter().print(sb);
        }

        protected void doGet(HttpServletRequest request, HttpServletResponse response)
                throws ServletException, IOException {
                serveRequest(request, response, "doGet");
        }

        protected void doPost(HttpServletRequest request, HttpServletResponse response)
                throws ServletException, IOException {
                serveRequest(request, response, "doPost");
        }
}
```

Testing FirstServlet.java

Run the project on server…
http://localhost:8080/FirstServletProject/FirstServlet should show you this:

JEE development

EJB (stateless and stateful) gets called from Servlet / JSP (in same Web-App)

```
File -> New -> Dynamic Web Project
```

Right click the newly created `Project -> Run As -> Run on Server`

Create a JSP to test project set-up:

Right click on project:
`New -> JSP File` (if you can't find JSP File then go: New -> Other -> Web -> JSP File)

When you go your **index.jsp** opened in the editor, replace its code with the code below and run it.
You should now see a big Hello World! If not, you probably did something wrong in the previous steps.

```
<%@page contentType="text/html" pageEncoding="UTF-8"%>
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
                      "http://www.w3.org/TR/html4/loose.dtd">

<html>
  <head>
        <meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
        <title>GlassFish JSP Page</title>
  </head>
  <body>
    <h1>Hello World!</h1>
  </body>
</html>
```

Save and run it:

Right click on project:

`New -> Servlet`

Replace in the generated Servlet-Class all methods with this code:

```
// ServletCallsLocalEJB belongs to 03_a_EJBs_statefull_stateless
// --------------------            -----------------------------
package com.rothlin.hwz;

import java.io.IOException;
import javax.servlet.ServletConfig;
import javax.servlet.ServletException;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;

@WebServlet("/ServletCallsLocalEJB")
public class ServletCallsLocalEJB extends HttpServlet {
	private static final long serialVersionUID = 1L;

	public ServletCallsLocalEJB() {
		super();
		System.out.println("ServletCallsLocalEJB::ctr() is called! Object created!!!");
	}

	public void init(ServletConfig servletConfig) throws ServletException {
		System.out.println("ServletCallsLocalEJB::init() is called!");
	}

	public void destroy() {
		System.out.println("ServletCallsLocalEJ::destroy() is called!");
	}

	private void serveRequest(HttpServletRequest request, HttpServletResponse response, String methode)
			throws ServletException, IOException {
		response.setContentType("text/html");
		StringBuffer sb = new StringBuffer("<html>\n<head>\n</head>\n<body>\n");
		sb.append("<H1>Hallo from ServletCallsLocalEJB!</H1> Methode:<B>" + methode + "</B><br/>\n");
		sb.append("</body>\n</html>\n");
		response.getWriter().print(sb);
		}

	protected void doGet(HttpServletRequest request, HttpServletResponse response)
			throws ServletException, IOException {
		serveRequest(request, response, "doGet");
	}

	protected void doPost(HttpServletRequest request, HttpServletResponse response)
			throws ServletException, IOException {
		serveRequest(request, response, "doPost");
	}
}
```

Save and run it:

Create **stateless** EJB in the same project (Web-App):

Right click on project:
`New -> Other -> EJB -> Session Bean (EJB 3.x)`

Code for **stateless** EJB:

EJB_A_StatelessRemote.java

```
// EJB_A_StatelessRemote belongs to 03_a_EJBs_statefull_stateless
// ---------------------           ----------------------------
package com.rothlin.hwz;

import javax.ejb.Remote;

@Remote
public interface EJB_A_StatelessRemote {
        public String pingRemote();
}
```

EJB_A_StatelessLocal.java

```
// EJB_A_StatelessLocal belongs to 03_a_EJBs_statefull_stateless
// --------------------            ----------------------------
package com.rothlin.hwz;

import javax.ejb.Local;

@Local
public interface EJB_A_StatelessLocal {
        public String pingLocal();
        public String pingRemote();
}
```

EJB_A_Stateless.java

```
// EJB_A_Stateless belongs to 03_a_EJBs_statefull_stateless
// ---------------            ----------------------------
package com.rothlin.hwz;

import javax.annotation.PostConstruct;
import javax.annotation.PreDestroy;
import javax.ejb.LocalBean;
import javax.ejb.Stateless;

@Stateless
@LocalBean
public class EJB_A_Stateless implements EJB_A_StatelessRemote, EJB_A_StatelessLocal {
        private int counter;

    public EJB_A_Stateless() {
        System.out.println("EJB_A_Stateless::ctr() called!");
    }

    @PostConstruct
    public void startup() {
        System.out.println("EJB_A_Stateless::startup() called!");
        counter = 10;
    }

    @PreDestroy
    public void cleanup() {
        System.out.println("EJB_A_Stateless::cleanup() called!");
    }

        @Override
        public String pingRemote() {
        counter++;
        return "EJB_A_Stateless::pingRemoteOnly(): counter: " + counter;
        }

        @Override
        public String pingLocal() {
        counter++;
        return "EJB_A_Stateless::pingLocal(): counter: " + counter;
        }
}
```

Create **stateful** EJB in the same project (Web-App):

Right click on project:
`New -> Other -> EJB -> Session Bean (EJB 3.x)`

Code for **stateful** EJB:

EJB_B_StatefulRemote.java

```
// EJB_B_StatefulRemote belongs to 03_a_EJBs_statefull_stateless
// --------------------           ----------------------------
package com.rothlin.hwz;

import javax.ejb.Remote;

@Remote
public interface EJB_B_StatefulRemote {
        public String pingRemote();
}
```

EJB_B_StatefulLocal.java

```
// EJB_B_StatefulLocal belongs to 03_a_EJBs_statefull_stateless
// -------------------            ----------------------------
package com.rothlin.hwz;

import javax.ejb.Local;

@Local
public interface EJB_B_StatefulLocal {
        public String pingLocal();
        public String pingRemote();
}
```

EJB_B_Stateful.java

```
// EJB_B_Stateful belongs to 03_a_EJBs_statefull_stateless
// --------------            ----------------------------
package com.rothlin.hwz;

import javax.annotation.PostConstruct;
import javax.annotation.PreDestroy;
import javax.ejb.LocalBean;
import javax.ejb.Stateful;

@Stateful
@LocalBean
public class EJB_B_Stateful implements EJB_B_StatefulRemote, EJB_B_StatefulLocal {
        private int counter;

    public EJB_B_Stateful() {
        System.out.println("EJB_B_Stateful::ctr() called!");
    }

    @PostConstruct
    public void startup() {
        System.out.println("EJB_B_Stateful::startup() called!");
        counter = 10;
    }

    @PreDestroy
    public void cleanup() {
        System.out.println("EJB_B_Stateful::cleanup() called!");
    }

        @Override
        public String pingRemote() {
        counter++;
        return "EJB_B_Stateful::pingRemoteOnly(): counter: " + counter;
        }

        @Override
        public String pingLocal() {
        counter++;
        return "EJB_B_Stateful::pingLocal(): counter: " + counter;
        }
}
```

Extend your Servlet-Code with the yellow lines:

```
// ServletCallsLocalEJB belongs to 03_a_EJBs_statefull_stateless
// --------------------            ----------------------------
package com.rothlin.hwz;

import javax.ejb.EJB;
import java.io.IOException;
import javax.servlet.ServletConfig;
import javax.servlet.ServletException;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;

@WebServlet("/ServletCallsLocalEJB")
public class ServletCallsLocalEJB extends HttpServlet {
        private static final long serialVersionUID = 1L;

        @EJB
        EJB_A_Stateless aLocalEJB;

        @EJB
        EJB_B_Stateful bLocalEJB;

        public ServletCallsLocalEJB() {
                super();
                System.out.println("ServletCallsLocalEJB::ctr() is called! Object created!!!");
        }

        public void init(ServletConfig servletConfig) throws ServletException {
                System.out.println("ServletCallsLocalEJB::init() is called!");
        }

        public void destroy() {
                System.out.println("ServletCallsLocalEJ::destroy() is called!");
        }

        private void serveRequest(HttpServletRequest request, HttpServletResponse response, String methode)
                        throws ServletException, IOException {
                response.setContentType("text/html");
                StringBuffer sb = new StringBuffer("<html>\n<head>\n</head>\n<body>\n");
                sb.append("<H1>Hallo from ServletCallsLocalEJB!</H1> Methode:<B>" + methode +
"</B><br/>\n");
                sb.append("<BR/>" + aLocalEJB.pingLocal()  + "\n");
                sb.append("<BR/>" + aLocalEJB.pingRemote() + "<BR/>\n");

                sb.append("<BR/>" + bLocalEJB.pingLocal()  + "\n");
                sb.append("<BR/>" + bLocalEJB.pingRemote() + "\n");
                sb.append("</body>\n</html>\n");
                response.getWriter().print(sb);
                }

        protected void doGet(HttpServletRequest request, HttpServletResponse response)
                        throws ServletException, IOException {
                serveRequest(request, response, "doGet");
        }

        protected void doPost(HttpServletRequest request, HttpServletResponse response)
                        throws ServletException, IOException {
                serveRequest(request, response, "doPost");
        }
}
```

Save and run it. After a while you will see the following:

EJB (stateless and stateful) gets called from **Servlet** remotely

```
File -> New -> Dynamic Web Project
```

Right click on project:

```
New -> Servlet
```

Replace in the generated Servlet-Class all methods with this code:

```
// ServletCallsRemoteEJBs belongs to 03_b_ServletCallsEJBsRemotely
// ----------------------            ----------------------------

package com.rothlin.hwz;

import java.io.IOException;
import javax.servlet.ServletConfig;
import javax.servlet.ServletException;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;

@WebServlet("/ServletCallsRemoteEJBs")
public class ServletCallsRemoteEJBs extends HttpServlet {
        private static final long serialVersionUID = 1L;

        public ServletCallsRemoteEJBs() {
                System.out.println("ServletCallsRemoteEJBs::ctr() is called! Object created!!!");
        }

        public void init(ServletConfig servletConfig) throws ServletException {
                System.out.println("ServletCallsRemoteEJBs::init() is called!");
        }

        public void destroy() {
                System.out.println("ServletCallsRemoteEJBs::destroy() is called!");
        }

        private void serveRequest(HttpServletRequest request, HttpServletResponse response, String methode)
                        throws ServletException, IOException {
                response.setContentType("text/html");
                StringBuffer sb = new StringBuffer("<html>\n<head>\n</head>\n<body>\n");
                sb.append("<H1>Hallo from ServletCallsRemoteEJBs!</H1><BR/>\n");
                sb.append("Methode:<B>" + methode + "</B><br/>\n");
                sb.append("</body>\n</html>\n");
                response.getWriter().print(sb);
        }

        protected void doGet(HttpServletRequest request, HttpServletResponse response)
                        throws ServletException, IOException {
                serveRequest(request, response, "doGet");
        }

        protected void doPost(HttpServletRequest request, HttpServletResponse response)
                        throws ServletException, IOException {
                serveRequest(request, response, "doPost");
        }
}
```

Save and run it.

Extend your Servlet-Code with the yellow lines:

```
// ServletCallsRemoteEJBs belongs to 03_b_ServletCallsEJBsRemotely
// ----------------------            ----------------------------
package com.rothlin.hwz;

import java.io.IOException;
import javax.naming.InitialContext;
import javax.servlet.ServletConfig;
import javax.servlet.ServletException;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;

@WebServlet("/ServletCallsRemoteEJBs")
public class ServletCallsRemoteEJBs extends HttpServlet {
        private static final long serialVersionUID = 1L;

        private static final String jndiHost                        = "127.0.0.1";

                sb.append("ejbA.pingRemote():<B>" + ejbA.pingRemote() + "</B><br/>\n");
                sb.append("ejbB.pingRemote():<B>" + ejbB.pingRemote() + "</B><br/>\n");
                sb.append("</body>\n</html>\n");
                response.getWriter().print(sb);
        }

        protected void doGet(HttpServletRequest request, HttpServletResponse response)
                        throws ServletException, IOException {
                serveRequest(request, response, "doGet");
        }

        protected void doPost(HttpServletRequest request, HttpServletResponse response)
                        throws ServletException, IOException {
                serveRequest(request, response, "doPost");
        }
}
```

Copy the two Remote-Interface to your project (**`EJB_A_StatelessRemote, EJB_B_StatefulRemote`**)

Save and run it.

EJB (stateless and stateful) gets called from a **Java-Client (POJO)**

Right click on project:

`New -> Java Project`

Set it up as an Glassfish-Client

`Right click -> Properties -> Project Facets -> Runtimes -> Glassfish 4`

If you don't see this view right away just press this.

Right click -> Properties -> Java Build Path -> Libraries

`File -> New -> Other -> Java -> Class`

Copy the two Remote-Interface to your project (**`EJB_A_StatelessRemote, EJB_B_StatefulRemote`**)

Replace in code in the generated Java-Class with this code:

```
// PojoCallsRemoteEJBs belongs to 03_c_PojoCallsEJBsRemotely
// -------------------            -------------------------

package com.rothlin.hwz;

import javax.naming.InitialContext;

public class PojoCallsRemoteEJBs {

        private static final String jndiHost                        = "127.0.0.1";
        private static final String jndiPort                        = "3700";
        private static final String jndiName__EJB_A_StatelessRemote =
"java:global/03_a_EJBs_stateful_stateless/EJB_A_Stateless!com.rothlin.hwz.EJB_A_StatelessRemote";
        private static final String jndiName__EJB_B_StatefulRemote  =
"java:global/03_a_EJBs_stateful_stateless/EJB_B_Stateful!com.rothlin.hwz.EJB_B_StatefulRemote";

        private EJB_A_StatelessRemote ejbA = null;
        private EJB_B_StatefulRemote  ejbB = null;

        public PojoCallsRemoteEJBs() {
                System.out.println("PojoCallsBruchEJB:: ctr() is called!");
                System.setProperty("org.omg.CORBA.ORBInitialHost", jndiHost);
                        try {
                                InitialContext ctx = new InitialContext();
                                ctx.addToEnvironment("org.omg.CORBA.ORBInitialHost", jndiHost);
                                ctx.addToEnvironment("org.omg.CORBA.ORBInitialPort", jndiPort);
                                ejbA = (EJB_A_StatelessRemote) ctx.lookup(jndiName__EJB_A_StatelessRemote);
                                ejbB = (EJB_B_StatefulRemote)  ctx.lookup(jndiName__EJB_B_StatefulRemote);
                        }
                        catch (Exception ex) {
                                System.out.println("Could not get remote-object bean!" + ex);
                        }
        }

        public void runClient() {
                        System.out.println("PojoCallsRemoteEJBs has been started!");
                        System.out.println("ejbA.pingRemote(): " + ejbA.pingRemote());
                        System.out.println("ejbB.pingRemote(): " + ejbB.pingRemote());
        }

        public static void main(String[] args) {
                PojoCallsRemoteEJBs cli = new PojoCallsRemoteEJBs();
                try {
                        cli.runClient();
                } catch (Exception e) {
                        e.printStackTrace();
                }
        }
}
```

Save and run it.

Create Bean to get called from Servlet / JSP in the "FirsServletProject"

```
File -> New -> Other -> EJB -> Session Bean (EJB 3.x)
```

Code for bean:

A_Bean.java

```
package com.rothlin.hwz;

import javax.ejb.LocalBean;
import javax.ejb.Stateless;

@Stateless
@LocalBean
public class A_Bean implements A_BeanRemote, A_BeanLocal {

        private int counter;

        public A_Bean() {
               System.out.println("Konstruktor von A_Bean aufgerufen!");
               counter = 10;
        }

        public String sayHello(String name) {
                counter++;
                return "HALLO    " + name + ": Der Counter ist: " + counter;
        }
}
```

A_BeanLocal.java

```
package com.rothlin.hwz;

import javax.ejb.Local;

@Local
public interface A_BeanLocal {
        public String sayHello(String name);
}
```

A_BeanRemote.java

```
package com.rothlin.hwz;

import javax.ejb.Remote;

@Remote
public interface A_BeanRemote {
        public String sayHello(String name);
}
```

Call Bean-method from Servlet (same web-App):

Add the following code to **FirstServlet.java**:

```
package com.rothlin.hwz;

import java.io.IOException;

import javax.ejb.EJB;
import javax.servlet.ServletConfig;
import javax.servlet.ServletException;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;

@WebServlet("/FirstServlet")
public class FirstServlet extends HttpServlet {
	private static final long serialVersionUID = 1L;

	@EJB
	A_Bean myBean;

	public FirstServlet() {
		super();
		System.out.println("FirstServlet ctr is called! Object created!!!");
	}

	public void init(ServletConfig servletConfig) throws ServletException {
		System.out.println("FirstServlet init() is called!");
	}

	public void destroy() {
		System.out.println("FirstServlet destroy() is called!");
	}

	private void serveRequest(HttpServletRequest request, HttpServletResponse
response, String methode)
		throws ServletException, IOException {
		response.setContentType("text/html");
		StringBuffer sb = new StringBuffer("<html>\n<head>\n</head>\n<body>\n");
		sb.append("<H1>Hallo HWZ!</H1> Methode:<B>" + methode + "</B><br/>\n");
		sb.append("<H2>" + myBean.sayHello("Walti")  + "</H2>\n");
		sb.append("</body>\n</html>\n");
		response.getWriter().print(sb);
	}

	protected void doGet(HttpServletRequest request, HttpServletResponse response)
		throws ServletException, IOException {
		serveRequest(request, response, "doGet");
	}

	protected void doPost(HttpServletRequest request, HttpServletResponse response)
		throws ServletException, IOException {
		serveRequest(request, response, "doPost");
	}
}
```

Testing Servlet calling local bean

Remove deployment before you deploy the FirstServletProject, or you will get an internal server error.

After you deployed your project again, your servlet is running and if you test in a browser, you see

The counter starts with 11.

Call Bean-method from JSP (same web-App)

Add the following code to index.jsp:

```
<%@page contentType="text/html" pageEncoding="UTF-8"%>
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
                      "http://www.w3.org/TR/html4/loose.dtd">

<%@page          import ="com.rothlin.hwz.A_Bean" %>
<jsp:useBean     id     ="userBean" class="com.rothlin.hwz.A_Bean" scope="session"/>

<html>
  <head>
        <meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
        <title>GlassFish JSP Page</title>
  </head>
  <body>
    <h1>Hello World!</h1>
    <%= userBean.sayHello("HWZ") %><HR/>
  </body>
</html>
```

Testing JSP calling EJB local

Example output after redeploy:

Create an EJB (Enterprise Java Bean) in another project (Remote)

```
File -> New -> Other -> EJB Project
```

File -> New -> Other -> EJB -> Session Bean (EJB 3.x)

First EJB Code

Replace the existing code of the following classes with these:

TestBean.java:

```
package com.rothlin.hwz;

import javax.annotation.PostConstruct;
import javax.annotation.PreDestroy;
import javax.ejb.LocalBean;
import javax.ejb.Stateless;

@Stateless
@LocalBean
public class TestBean implements TestBeanRemote, TestBeanLocal {

	@PostConstruct
	private void startup() {
	   System.out.println("TestBean: PostConstruct!!");
	}

	@PreDestroy
	public void cleanup() {
	   System.out.println("TestBean: cleanup!");
	}

	public String ping() {
	    return "TestBean V1.0";
	}

	public TestBean() {
	    System.out.println("TestBean: ctr called!");
	}
}
```

TestBeanLocal.java

```
package com.rothlin.hwz;

import javax.ejb.Local;

@Local
public interface TestBeanLocal {
	public String ping();
}
```

TestBeanRemote.java

```
package com.rothlin.hwz;

import javax.ejb.Remote;

@Remote
public interface TestBeanRemote {
	public String ping();
}
```

Deploy EJB

Select the EJB Project and click on Run as -> Run on Server

A Portable JNDI name will be created (check serverlog):

```
2017-04-03T14:11:42.223+0200|Info: Portable JNDI names for EJB TestBean:
[java:global/testEJB/TestBean!com.rothlin.hwz.TestBeanLocal,
java:global/testEJB/TestBean!com.rothlin.hwz.TestBean,
java:global/testEJB/TestBean!com.rothlin.hwz.TestBeanRemote]
```

Call EJB Methode from "FirstServlet"

Modify the servlet-code as following:

```
package com.rothlin.hwz;

import java.io.IOException;

import javax.ejb.EJB;
import javax.naming.InitialContext;
import javax.servlet.ServletConfig;
import javax.servlet.ServletException;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;

@WebServlet("/FirstServlet")
public class FirstServlet extends HttpServlet {
        private static final long serialVersionUID = 1L;

        @EJB
        A_Bean myBean;

        TestBeanRemote aTestBean = null;

        public FirstServlet() {
                super();
                System.out.println("FirstServlet ctr is called! Object created!!!");
        }

        public void init(ServletConfig servletConfig) throws ServletException {
                System.out.println("FirstServlet init() is called!");
                System.setProperty("org.omg.CORBA.ORBInitialHost", "127.0.0.1");
                try {
                        InitialContext ctx = new InitialContext();
                        ctx.addToEnvironment("org.omg.CORBA.ORBInitialHost", "127.0.0.1");
                        ctx.addToEnvironment("org.omg.CORBA.ORBInitialPort", "3700");
                        aTestBean = (TestBeanRemote) ctx.lookup
                             ("java:global/testEJB/TestBean!com.rothlin.hwz.TestBeanRemote");
                }
                catch (Exception ex) {
                    System.out.println("Couldn't create converter bean!" + ex);
                }
        }

        public void destroy() {
                System.out.println("FirstServlet destroy() is called!");
        }

        private void serveRequest(HttpServletRequest  request,
                                  HttpServletResponse response, String methode)
                throws ServletException, IOException {
                response.setContentType("text/html");
                StringBuffer sb = new StringBuffer("<html>\n<head>\n</head>\n<body>\n");
                sb.append("<H1>Hallo HWZ!</H1> Methode:<B>" + methode + "</B><br/>\n");
                sb.append("<H2>" + myBean.sayHello("Walti")  + "</H2>\n");
                sb.append("<H2>" + aTestBean.ping() + "</H2>\n");
                sb.append("</body>\n</html>\n");
                response.getWriter().print(sb);
        }

        protected void doGet(HttpServletRequest request, HttpServletResponse response)
                throws ServletException, IOException {
                serveRequest(request, response, "doGet");
        }

        protected void doPost(HttpServletRequest request, HttpServletResponse response)
                throws ServletException, IOException {
                serveRequest(request, response, "doPost");
        }
}
```

Fixen der Projektübergreifenden Interfaces

Um den Fehler des vermissten **TestBeanRemote** zu fixen, kopieren sie das gleichnamige File vom **testEJB**-Projekt in das **FirstServletProject**

Es gibt auch die Möglichkeit die Resourcen im **testEJB** im **FirstServletProject** bekannt zu machen:
Add testEJB Project to FirstServletProject

```
File -> Properties -> Java Build Path
```

If the project testEJB is visible as build path, close the window.

Testen des Servlets mit EJB local and remote call

Wichtig: wird nun der Code des EJB geändert und deployed, muss auch das Servlet neu geladen werden (die init() function muss aufgerufen werden und eine neue Remote-Referenz via JNDI geholt werden). Am einfachsten macht man das, indem der Servlet Code geändert wird und wieder abgespeichert, so wird das Servlet ebenfalls neu deployed und init() aufgerufen.

Java-client calls EJB-Methode

File -> New -> Other -> Java -> Java Project

Right click -> Properties -> Project Facets -> Runtimes -> Glassfish 4

Right click -> Properties -> Java Build Path -> Libraries

File -> New -> Other -> Java -> Class

TestClient_EJB.java

```
package com.rothlin.hwz;

import javax.naming.InitialContext;

public class TestClient_EJB {
	public void runTest() throws Exception {
		System.setProperty("org.omg.CORBA.ORBInitialHost", "127.0.0.1");
		InitialContext ctx = new InitialContext();

		/* calling stateless session bean */
		System.out.println("Calling TestBean (Session stateless)");
		ctx.addToEnvironment("org.omg.CORBA.ORBInitialHost", "127.0.0.1");
		ctx.addToEnvironment("org.omg.CORBA.ORBInitialPort", "3700");

		TestBeanRemote bean = (TestBeanRemote) ctx.lookup
				("java:global/testEJB/TestBean!com.rothlin.hwz.TestBeanRemote");

		System.out.println(bean.ping());

	}

	public static void main(String[] args) {
		TestClient_EJB cli = new TestClient_EJB();
		try {
			cli.runTest();
		} catch (Exception e) {
			e.printStackTrace();
		}
	}
}
```

File -> New -> Other -> Java -> Java Interface

TestBeanRemote.java

```
package com.rothlin.hwz;

public interface TestBeanRemote {
	public String ping();
}
```

This is how the Package Explorer should look like:

Create own WEB-Service

File -> New -> Other -> Web -> Dynamic Web Project

File -> New -> Other -> Java -> Class

Add the following code:

```
package com.rothlin.webservice;

import javax.jws.WebMethod;
import javax.jws.WebService;

@WebService
public class FirstWebService {

        // Methodes in a web-Service are called Operations
        // Operation names can not be overloaded (
        @WebMethod
        public String sayHello() {
                return "Hello HWZ";
        }

        @WebMethod() // ctrl-space shows you the options
        public String sayHelloName(String name) {
                return "Hello " + name;
        }

        @WebMethod(exclude=false)
        public String sayAnredeName(String anrede, String name) {
                return anrede + " " + name;
        }
}
```

Run java class on Server and check Admin Console

Tester — To test the operation. When you want to test the Web-Service without writing a client, click on the Tester-Link which is given in the Web Service Endpoint Information.

WSDL — To get the generated WSDL.

Create Java-Client calling WEB-Service

File -> New -> Java Project

Create the stub-classes from wsdl-file:

New -> Other… -> Web Service -> Web Service Client

http://localhost:8080/WS_Service/FirstWebServiceService?wsdl

Other way to create stub-classes:

Generate Client Stub from WSDL in dos-prompt:

```
mkdir sei
cd sei
mkdir src
wsimport -keep -s src http://DESKTOP-0ORFPM9:8080/04_a_Webservice_Simple/FirstWebServiceService?wsdl
```

Created stub-classes:

File -> New -> Java Project

File -> New -> Package

Create client:

File -> New -> Class

```
package com.rothlin.wsClient;

import java.rmi.RemoteException;
import com.rothlin.webservice.FirstWebServiceProxy;

public class WebServiceClient {

	public static void main(String[] args) throws RemoteException {
		FirstWebServiceProxy ws = new FirstWebServiceProxy();
		System.out.println(ws.sayHello());
		System.out.println(ws.sayHelloName("BWI-14"));
		System.out.println(ws.sayAnredeName("Herr","Peter"));
		System.out.println(ws.calcCircleArea(5.0));
		System.out.println(ws.calcCircleUmfang(5.0));
	}
}
```

Create a Java Client which calls a public Web-Service

Used Web-Service (Converts an IP-address to a country name):
http://www.webservicex.net/geoipservice.asmx?WSDL

```
package com.rothlin.wsClient;

import net.webservicex.GeoIP;
import net.webservicex.GeoIPService;
import net.webservicex.GeoIPServiceSoap;

public class WebServiceClient {

        static public String getCountryNameForIP(String ipAddress) {
                // from WSDL: <wsdl:service name="GeoIPService">
                GeoIPService ipService = new GeoIPService();

                // from WSDL: <wsdl:port name="GeoIPServiceSoap">
                GeoIPServiceSoap geoIPServiceSoap = ipService.getGeoIPServiceSoap();

                GeoIP geoIp = geoIPServiceSoap.getGeoIP(ipAddress);
                return geoIp.getCountryName();
        }

        public static void main(String[] args) {
                if (args.length != 1) {
                        System.out.println("You need to pass one IP address!");
                        System.out.println("\nSome test cases:");
                        String ipAddress = "193.134.255.237";
                        System.out.println(ipAddress + " --> " + getCountryNameForIP(ipAddress));
                        ipAddress = "212.58.246.103";
                        System.out.println(ipAddress + " --> " + getCountryNameForIP(ipAddress));

                } else {
                        String ipAddress = args[0];
                        System.out.println(ipAddress + " --> " + getCountryNameForIP(ipAddress));

                }

        }

}
```

Create TCP/IP Server-Client

File -> New -> Other -> Java -> Class

```
import java.io.*;
import java.net.*;

class TCP_Server {
   public static void main(String argv[]) throws Exception {
         String clientSentence;
         String upperSentence ;
         ServerSocket welcomeSocket = new ServerSocket(6789);

         System.out.println("TCP/IP Server started!");
         while(true) {
            System.out.println("TCP/IP Server waiting to be called....");
            Socket connectionSocket = welcomeSocket.accept();
            BufferedReader inFromClient =
               new BufferedReader(
                 new InputStreamReader(connectionSocket.getInputStream()));

            DataOutputStream outToClient =
               new DataOutputStream(connectionSocket.getOutputStream());

            clientSentence = inFromClient.readLine();
            System.out.println("Received from Client: " + clientSentence);
            upperSentence  = clientSentence.toUpperCase() + '\n';
            System.out.println("Sent back to Client : " + upperSentence );
            outToClient.writeBytes(upperSentence);
         }
      }
}
```

File -> New -> Other -> Java -> Class

```java
import java.io.*;
import java.net.*;

class TCP_Client {
        public static void main(String argv[]) throws Exception {
                String sentence;
                String modifiedSentence;

                BufferedReader inFromUser =
                      new BufferedReader(
                        new InputStreamReader(System.in));
                Socket clientSocket = new Socket("localhost", 6789);

                DataOutputStream outToServer =
                      new DataOutputStream(clientSocket.getOutputStream());

                BufferedReader inFromServer =
                      new BufferedReader(
                        new InputStreamReader(clientSocket.getInputStream()));

                System.out.print("Enter a String      : ");
                sentence = inFromUser.readLine();

                System.out.println("Sent to SERVER      : " + sentence);

                outToServer.writeBytes(sentence + '\n');
                modifiedSentence = inFromServer.readLine();

                System.out.println("Received from SERVER: " + modifiedSentence);
                clientSocket.close();
                System.out.println("Client terminated!!!!!");
        }
}
```

Create TCP/IP Server-Client advanced

File -> New -> Other -> Java -> Class

File -> New -> Other -> Java -> Class

Add the following code to TCP_Server_1:

```
import java.io.*;
import java.net.*;

public class TCP_Server_1 {
   private static String businessFct_A(String msg) {
     return msg.toUpperCase() + '\n';
   }

   private static String businessFct_B(String msg) {
     return msg.toLowerCase() + '\n';
   }

   public static void main(String argv[]) throws Exception {
     String clientMsg;
     String replyMsg;
     ServerSocket welcomeSocket = new ServerSocket(6789);

     System.out.println("TCP/IP Server started!");
     while(true) {
        System.out.println("TCP/IP Server waiting to be called....");
        Socket connectionSocket = welcomeSocket.accept();
        BufferedReader inFromClient =
               new BufferedReader(
                  new InputStreamReader(connectionSocket.getInputStream()));
        DataOutputStream outToClient =
                  new DataOutputStream(connectionSocket.getOutputStream());

        clientMsg = inFromClient.readLine();
        System.out.println("Received from Client: " + clientMsg);
        String[] msgParts = clientMsg.split(":");
        String fctName   = msgParts[0];
        String stringMsg = msgParts[1];
        System.out.println("    Function : " + fctName);
        System.out.println("    Parameter: " + stringMsg);

        if (fctName.equals("toUpper")) {
                replyMsg  = businessFct_A(stringMsg);
        } else if (fctName.equals("toLower")) {
                replyMsg  = businessFct_B(stringMsg);
        } else {
                replyMsg  = "ERROR: Unknown Function " + fctName + '\n';
        }
        System.out.println("Sent back to Client : " + replyMsg );
        outToClient.writeBytes(replyMsg);
     }
  }
}
```

Add the following code to TCP_Client_1:

```
import java.io.*;
import java.net.*;

public class TCP_Client_1 {
  public static void main(String argv[]) throws Exception {
        String sentence;
        String fctName;
        String modifiedSentence;

        BufferedReader inFromUser = new BufferedReader(
                new InputStreamReader(System.in));

        Socket clientSocket = new Socket("localhost", 6789);

        DataOutputStream outToServer =
                 new DataOutputStream(clientSocket.getOutputStream());

        BufferedReader inFromServer =
                new BufferedReader(
                    new InputStreamReader(clientSocket.getInputStream()));

        System.out.print("Enter function name : ");
        fctName = inFromUser.readLine();
        System.out.print("Enter a String      : ");
        sentence = inFromUser.readLine();

        System.out.println("Sent to SERVER      : " + fctName + ":" + sentence);
        outToServer.writeBytes(fctName + ":" + sentence + '\n');
        modifiedSentence = inFromServer.readLine();
        System.out.println("Received from SERVER: " + modifiedSentence);
      clientSocket.close();
        System.out.println("Client terminated!!!!!");
   }
}
```

Create RMI Client-Server

File -> New -> Other -> Java -> Java Project

File -> New -> Other -> Java -> Package

File -> New -> Other -> Java -> Class

```
package com.interf.test;

import java.rmi.Remote;
import java.rmi.RemoteException;

public interface TestRemote extends Remote{
        public boolean isLoginValid(String username) throws RemoteException;
}
```

File -> New -> Other -> Java -> Class

```
package com.interf.test;

public class Constant {
        public static final String RMI_ID = "TestRMI";
        public static final int RMI_PORT = 222;
}
```

File -> New -> Other -> Java -> Java Project

File -> New -> Other -> Java -> Java Package

File -> New -> Other -> Java -> Class

```java
package com.test;

import java.rmi.RemoteException;
import java.rmi.server.UnicastRemoteObject;

import com.interf.test.TestRemote;

public class RemoteImpl extends UnicastRemoteObject implements TestRemote {

	private static final long serialVersionUID = 1L;

	protected RemoteImpl() throws RemoteException {
		super();
	}

	@Override
	public boolean isLoginValid(String username) throws RemoteException {
		if (username.equals("test")) {
			return true;
		}
		return false;
	}
}
```

File -> New -> Other -> Java -> Class

```
package com.test;

import java.rmi.AlreadyBoundException;
import java.rmi.RemoteException;
import java.rmi.registry.LocateRegistry;
import java.rmi.registry.Registry;

import com.interf.test.Constant;

public class RMIServer {

        public static void main(String[] args)
                        throws RemoteException, AlreadyBoundException {
                RemoteImpl impl = new RemoteImpl();
                Registry registry = LocateRegistry.createRegistry(Constant.RMI_PORT);
                registry.bind(Constant.RMI_ID,impl);
                System.out.println("Server is started!");
        }
}
```

File -> New -> Other -> Java -> Java Project

File -> New -> Other -> Java -> Package

File -> New -> Other -> Java -> Class

```
package com.client;

import java.rmi.NotBoundException;
import java.rmi.RemoteException;
import java.rmi.registry.LocateRegistry;
import java.rmi.registry.Registry;

import com.interf.test.Constant;
import com.interf.test.TestRemote;

public class TestClient {
   public static void main(String[] args)
               throws RemoteException, NotBoundException {
         Registry registry = LocateRegistry.getRegistry("localhost", Constant.RMI_PORT);
         TestRemote remote = (TestRemote) registry.lookup(Constant.RMI_ID);
         System.out.println(remote.isLoginValid("test"));
         System.out.println(remote.isLoginValid("TEST"));
   }
}
```

Troubleshooting "DeploymentException" on Glassfish startup

The problem is discussed here.

Whenever you encounter a "`org.glassfish.deployment.common.DeploymentException`" when starting the server, try this:

- Stop the server.
- Navigate to the glassfish installation directory and delete the contents of the "generated" folder.
- Try to restart the server.
- If the error persists, follow with the next steps.

- In the Eclipse Menubar, navigate to Window > Preferences > Server > Runtime Environments and select the Glassfish server and delete it:

Then close eclipse and proceed with the next step.

- Open an Explorer window and navigate to you Glassfish installation folder. Then navigate to /domains/ and delete every file and folder in there.
- Now you can open up eclipse again and navigate to Window > Preferences > Server > Runtime Environments like before. There you click on Add...

Leave the "Create a new local server"-Checkbox unticked! Then click on Next.

- Enter a Name for the server (doesn't matter) and the path to the glassfish installation in the appropriate box. Then click on finish
- Navigate to Window > Show View and Select "Servers" then click on the blue, underlined text.

Then click on Next.

- Behind the "Domain path" textfield click on the three stars and enter a domainname

Then click on finish and in the other window also on Finish

- Now we have to create a new Eclipse project and copy all files and folders from the old project to the new one. This includes all java source files, webfiles like .html .xhtml .jsf.jsp. This is accomplished by following the next steps.
- Navigate to File > New > Dynamic Web Project. Target Runtime should be the Glassifsh runtime created before.

Click on Finish

- Copy all webfiles from WebContent to the new project into the same folder. The web.xml should also be copied in the WEB-INF folder. The file glassfish-web.xml shouldn't be copied but can be editet to match additional configuration from the original Project. All Java Sources should be copied into the new project with the same package names.
- In you newly created project you shouldn't see any errors related to not finding Servlet classes. This means everything is properly set up and you can launch your application.

Give a Remote Computer access to MySQL

To give authorization to another computer to access any DB, please start MySql Workbench. Go to "Users and Privileges". Click on the "Add Account" Button and fill in the requested data, which is needed to get an access. Leave the password blank.

Login Name: admin
Password: admin

After you have created an account go to "Administrative Roles" and give the account the needed rights.

This is the ERD of Sakila, which is one of the default databases from the MySQL Workbench.

Download MySQL JDBC driver

https://dev.mysql.com/downloads/connector/j/

Please report any bugs or inconsistencies you observe to our Bugs Database.
Thank you for your support!

Generally Available (GA) Releases | Development Releases

Connector/J 5.1.45

Select Operating System:
Platform Independent

Platform Independent (Architecture Independent), Compressed TAR Archive (mysql-connector-java-5.1.45.tar.gz)	5.1.45	3.3M	Download MD5: ab9ac454a959859a297b53bdbf156f3c | Signature
Platform Independent (Architecture Independent), ZIP Archive (mysql-connector-java-5.1.45.zip)	5.1.45	3.6M	Download MD5: 2e3a933f8f7642345d5f34bf43374f8e | Signature

We suggest that you use the MD5 checksums and GnuPG signatures to verify the integrity of the packages you download.

Begin Your Download

mysql-connector-java-5.1.45.zip

Login Now or Sign Up for a free account.

An Oracle Web Account provides you with the following advantages:

- Fast access to MySQL software downloads
- Download technical White Papers and Presentations
- Post messages in the MySQL Discussion Forums
- Report and track bugs in the MySQL bug system
- Comment in the MySQL Documentation

Login » using my Oracle Web account | Sign Up » for an Oracle Web account

MySQL.com is using Oracle SSO for authentication. If you already have an Oracle Web account, click the Login link. Otherwise, you can signup for a free account by clicking the Sign Up link and following the instructions.

No thanks, just start my download.

Download the zip file and extract it. Then move the connector (mysql-connector-java-5.1.xxx-bin) to C:\glassfish\glassfish4\glassfish\lib Otherwise it won't work.

Select the MySQL JDBC Driver with the matching System Version (January 2015: 5.1) and select the «Jar List»-Tab. Remove the current Jar in the list and click on "Add JAR/Zip...".

Select "Add JAR/Zip". Then navigate to the installation directory of the glassfish-server and select the driver in the directory .../glassfish/lib/ select mysql-connector-java-5.1.0-bin and click on "Open".

MySQL Root Password: admin

Basic MySql commands

Start -> MySql Command Line Client

Command	Description
Show databases;	Shows you the already defined DBs.
Use test;	To use a DB.
Show tables;	Shows you all the tables from the using DB.
Create table Classmates (*Id int PRIMARY KEY NOT NULL,* *fname varchar (25),* *lname varchar (25)* *);* *CREATE UNIQUE INDEX PRIMARY ON CLASSMATES (ID);* *INSERT INTO classmates (id, lname, fname)* *VALUES (1, 'David', 'Etter');*	It creates a table with the name *Classmates". The table contains a primary key and to columns for the first- and lastname.

Setup a DB Connection via JNDI on the Application Server

Start the Glassfish Admin-Console and go to **Resources** -> **JDBC** -> **JDBC ConnectionPool** -> **New…**

Datasource Classname: com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource

Scroll to the end of the page and set these propertes:
User → root
Password → admin
DatabaseName → sakila
Url → jdbc:mysql://localhost:3306/sakila
URL → jdbc:mysql://localhost:3306/sakila

Simply press Finish at the end of the page.

(Die Werte der Properties können in der DB Perspective gefunden werden)

Define a new JNDI, that references our DB Connection:
JDBC Resources → New….

Simply press OK when you are done

Javadoc

Generating Javadoc

Click on *Project → Generate Javadoc…*

On the Javadoc command field, type: *C:\Program Files\Java\jdk1.8.0_152\bin\javadoc.exe*

Choose the project and the package where you'd like to generate the Javadoc.

Be sure to set the visibility to **Public.**

Click *Finish* when you are done.

Junit

Create Junit Test

open project -> right click on class -> New -> JUnit Test Case

When JUnit 4 is not on the build path follow these steps:
click on project -> press Alt + Enter -> Java Build Path -> Libraries -> Add External JARs -> JUnit 4
Implementing Tests and run it as JUnit Test

Coverage - Install EclEmma Plugin

```
Help -> Marketplace -> EclEmma
```

Coverage - Run Test with coverage report

Common Help

Finden der aktuelle IP eines Computers

start -> cmd -> ipconfig

(Example: The Computer is connected via WiFi)

Tips and Tricks for Eclipse

Obsolete: Download and Install MySQL Eclipse Plugin – Toad extension

This part of the guide is obsolete, since Toad Extension for Eclipse is no longer available.
Eclipse -> Help -> Eclipse Marketplace -> Toad Extension

Add MySQL JDBC driver

After restarting Eclipse…

If the window doesn't show up on restart:

Eclipse -> Window -> Preferences

Toad Extension -> Database Settings -> MySQL -> Add

Add the MySQL JDBC driver, which is located at C:\glassfish4\glassfish\lib.

Add MySQL connection

MySQL Root Password: admin

New MySQL Connection

MySQL Connection

Connection is OK.

Manual Settings

Connection Settings | SSL | SSH

Host: localhost

Port: 3306

Database: sakila

Encoding: utf8

MySQL

User: root

Password: *****

Save password

Enable AutoCommit

Restore previous work after login

Connection Name: root@localhost/sakila

Connection String Preview:

jdbc:mysql://localhost:3306/sakila?characterEncoding=utf8

Test Connection | OK | Cancel

New jar to eclipse project

Right click -> Properties -> Java Build Path -> Libraries

Shortcuts in Eclipse

Combination	Description
`left mousepad`	open declaration
`ctrl + F11`	run application
`ctrl + space`	auto complete
`Type:"sysout" ctrl + space`	system.out.println();
`select string + F2`	show tooltip in box with scrollbar
`shift + F2`	open java doc in browser
`ctrl + shift + O`	Add and removes (un)used imports
`ctrl + shift + F`	format the source code
`ctrl + shift + C`	comment

Automated publishing when source has been saved

Double click on Glassfish 4 at localhost {domain} {Started, Republish}.

Import Project in eclipse

Nach import ist alles rot!!!

Build-Path -> configure Built path
Alle Libraries die gefunden wurden -> remove
Add Library -> JRE System Library -> Workspace default
